

[SDI Review Form 1.6](#)

Journal Name:	Asian Journal of Environment & Ecology
Manuscript Number:	Ms_AJEE_51434
Title of the Manuscript:	Rainwater harvesting - a safety net for water security in Ghana
Type of the Article	Review Article

General guideline for Peer Review process:

This journal's peer review policy states that **NO** manuscript should be rejected only on the basis of '**lack of Novelty**', provided the manuscript is scientifically robust and technically sound. To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	<p>The paper is sometimes repeating former parts, which e.g. already have been mentioned in the introduction. Maybe it is possible to reorganize some parts, to prevent this.</p> <p>"The benefit of a few individuals looking for gold cannot be sacrificed at the altar of many who depend of the river bodies for their survival." I think this should be the other way around: the benefit of a few gold diggers cannot come at the expense of...</p> <p>What do you mean by: «All the efforts to control the activities of mining in the country is therefore in the right direction.» What is meant by the right direction?</p>	
Minor REVISION comments	<p>In section 2.0 it is stated that, because of the poor quality of surface water, ground water has to be used. But what about the quantity and quality of this groundwater? Besides, if surface waters are badly polluted, groundwater too may be affected.</p> <p>How do the extra costs for groundwater compare to extra costs required for surface water treatment? Is there a possibility to treat wastewater? In that case, not only a better source for drinking water would be obtained, but the environment, and possibly even groundwater quality, would also benefit from it.</p> <p>There is no problem in the availability of water for industrial applications, agriculture and drinking water in Germany. However, as especially in cities a high percentage of the surface area has been covered with buildings and roads etc., rainwater cannot penetrate the soil anymore, causing problems with flooding. For this reason e.g. Berlin has introduced a special tax to cover the costs of dealing with this water. As a result, buildings are now collecting rainwater, and when water has been collected, it might as well be used.</p> <p>In order to safely use rainwater as drinking water, disinfection really will be necessary!</p>	
Optional/General comments	<p>I recommend to have a look at the work of Kees van Leeuwen and Stef Koops on city blueprint. This gives an idea how to identify the problems and water management possibilities.</p>	

Comment [HR1]: What do you mean by this?
What is the right direction?
