

**Editor's Comment:**

Manuscript is very verbose and tiring to read, in the materials and methods section it is necessary to specify how the authors searched for the studies entered and on which databases (pub med, embase, etc) and with which queries. clarity is needed in the enunciation of the inclusion and exclusion criteria. If this is a systematic review, the result has not been achieved. What are the statistical methods used? The manuscript must be made simpler and more comprehensive and must meet the criteria of a systematic review. In my opinion the manuscript must be repropose in a different way.
