

**Editor's Comment:**

I read the article and I found out much wrong data.

First of all, descriptive and prospective study is different terms

Key-words are missing

Methodological biases exist (No study Protocol, References, we do not know how the Authors determine the study sample, Inclusion/Exclusion criteria are missing, Selection and Recall Biases are possible, Statistical analysis is missing, etc.)

The Authors could compare the indices examined during the period 2005-2011 using proper statistical models

In my opinion this article has nothing new to provide. It is a "simple" presentation of "trends"
