

Original Research Article

EFFECT OF THREE DRYING METHODS (OVEN, SOLAR AND SUN) ON THE MINERAL COMPOSITION OF ETHIOPIAN PEPPER

(Xylopia aethiopica)

The effect of oven, solar and sun drying methods on the mineral properties of the Ethiopian pepper was determined by conducting a study at the Department of Horticulture, KNUST using a Completely Randomized Design (CRD). The mineral properties analyzed were, calcium, iron, magnesium, sodium, zinc. Sun dried Ethiopian pepper, had significantly higher ($p \leq 0.01$) calcium (0.01%), iron (46.20mg/kg), magnesium (0.20%), sodium (0.9%), zinc (19.75mg/kg). Ethiopian Pepper dried under oven and solar drying methods retained the best minerals.

Comment [U1]: That's not what I see in table 4.2.

Comment [U2]: Idem

Comment [U3]: Oven was best for Zn content.

Keywords: Crucible, Distilled Water, Absorption Spectrophotometer, Replicates

16 **1. INTRODUCTION**

17

18 Ethiopian pepper (*Xylopi* *aethiopica* Insert authority) is of the Annonaceae family. The fresh
19 and dried fruits, leaf, stem bark and root bark contain essential oils which help fight several
20 bacteria and certain fungi ([7]; [8]).

21 *X. aethiopiaca* also contains substances such as zinc, lipids, proteins, carbohydrates, iodine,
22 saturated and unsaturated fatty acids, mono- and sesqui -terpenoids, and pinenes, myriene,
23 p.cymene, limonene, linalool and 1, 8, cineole (insert citation). The plant is widely distributed
24 in the West African rainforest from Senegal to Sudan in Eastern Africa, and down to
25 Angolain Southern Africa ([3]; [2]) where it is mostly used for local cooking, especially in the
26 preparation of what is referred to as 'the African pepper soup [2].The bark when steeped in
27 palm wine, is used to treat asthma, stomach-aches and rheumatism (insert citation).

28 The nutritional and chemical properties of fruit are affected as a result of the changes
29 occurring during drying. Prolonged drying may result in some changes that could negatively
30 affect some functional properties of the product (insert citation). There is little information on
31 the processing of Ethiopian pepper by farmers which they only adopt to the traditional sun
32 drying method, which sometimes unhygienic and time consuming. Alternative drying
33 methods are required to supplement the traditional drying methods to maintain some
34 desirable chemical characteristics in the fruit.

35 This research brings to light the appropriate drying methods which would still maintain the
36 chemical content of the fruits. The effect of the drying methods on the chemicals of Ethiopian
37 pepper has not been sufficiently investigated. It is therefore necessary to identify
38 appropriate, easy and cost - effective drying methods that will maintain the fruit chemical
39 properties. The research, therefore, sought to determine the effect of three drying methods
40 (oven, sun and solar) on the chemical of Ethiopian pepper.

Comment [U4]: Conclusions must be linked to this phrase.

41

42 **2. MATERIAL AND METHODS**

43

44 **2.1 EXPERIMENTAL SITE**

45 The experiment was conducted at the laboratories of the Department of Horticulture and
46 Department of Pharmacy, Kwame Nkrumah University of Science and Technology (KNUST),
47 Kumasi.

48 **2.2 SOURCE OF ETHIOPIAN PEPPER**

49 The Ethiopian pepper fruits were obtained from an out-grower farm located at Atobiase in
50 the Bosomtwe District of the Ashanti region. Physiologically matured fruits were harvested
51 and 300g of the fruit sample were weighed. The fruits were then graded and sorted to
52 ensure they were of uniform size, shape and without damages. The fruits were then grouped
53 into 3 sub-samples to be dried using the three drying methods (sun, oven and solar driers).
54 Dried fruits were then processed into fine powder by grinding after which the samples were
55 analyzed.

56

57 **Plate 1:** Freshly harvested Ethiopian pepper

58

59 **2.3 DRYING TREATMENTS**

60 **2.3.1 SUN DRYING**

61 One hundred grams (100g) of fresh *Xylopia* fruits were put on a metallic tray and placed on a
62 table directly under the sun light for 7 days. It was constantly stirred to ensure even drying
63 and uniformity. Temperature and humidity were recorded for the 7-day period and the mean
64 value recorded.

Comment [U5]: Ethiopian pepper or *Xylopia*? Use only one of the terms along the manuscript.

65

66 **Plate 2:** Sun dried *Xylopia* fruits

67

68 **2.3.2 SOLAR DRYING**

69 One hundred grams (100g) of fresh *Xylopia* fruits were put on a metallic tray and placed in
70 the solar dryer for 7 days. It was constantly stirred to ensure even drying and uniformity.
71 Temperature and humidity were recorded for the 7-days period and the mean value
72 recorded.

73

74 Plate 3: Solar dried *Xylopiya* fruits

75

76 **2.3.3 OVEN DRYING**

77 One hundred grams (100g) of fresh *Xylopiya* fruits were put on a clean metallic tray and
78 placed in the oven to dry at 60°C within 24 hours.

79

80 Plate 4: oven dried *Xylopiya* fruits.

81

82

83 **2.4 PARAMETERS STUDIED.**

84 **3.7 MINERAL DETERMINATION**

85 A 1.0g of powdered *Xylopia* was weighed into a porcelain crucible and ashed for 4 hours at
86 500°C. 10ml of 1:5 HCl to water was added to the ashed sample, digested on a hot plate
87 and boiled for 2 mins. The digest was then filtered into a 100 ml flask, (raising the crucible
88 well). The filtrate was made to the 100 ml meniscus mark of the volumetric flask using
89 distilled water (insert reference).

90 The solution was further diluted with distilled water at a ratio of 1:50 using a combined
91 solution of 2.5 ml lanthanum solution and 2.5 ml cesium oxide to remove the interference of
92 other cations. The potassium, magnesium, manganese, zinc, sodium, iron, calcium and
93 copper were read with the Absorption Spectrophotometer (AAS) using the respective
94 wavelength after calibration. The specific elements were then calculated as

95 Calculation

96 Dilution Factor 50

97 $(\text{Ca, Mg, Na, K}) \% = \text{Concentration} \times \text{df}$

98 $(\text{Ca, Mg, Na, K}) \% = \text{Concentration} \times 50/100 = \text{concentration} / 2$

99 The (Fe, Mn, Cu, Zn) ppm = concentration x coefficient factor

100

101 **2.7 DATA ANALYSIS**

102 Data obtained from the laboratory analysis was subjected to Analysis of Variance (ANOVA)
103 using STATISTIX version 9. The differences in means were separated using Turkey's
104 Honesty significant difference (HSD) at 1%. The results were then presented in table.

Comment [U6]: The results were expressed as percentage or ppm? This is not clear along the manuscript.

105 3. RESULTS

106

107 4.2 EFFECT OF THREE DRYING METHODS ON THE MINERAL CONTENTS OF THE 108 XYLOPIA

109 Table 4.2 presented the effect of three drying methods on the mineral contents of the
110 Xylophia. The effect of the drying methods on the mineral contents varies among the Xylophia.
111 K, Ca, Mg, Mn, Fe, Cu, were found in the dried Xylophia. Solar drying was found with highest
112 content of Cu, Ca and Fe regardless of the drying method used. Also, there was significantly
113 ($P < 0.01$) difference between Ca, Cu and Fe in-terms of the three drying methods used.
114 However, no significant ($P > 0.01$) difference exist in Mg and K content examined regardless
115 of the drying method used. Solar drying was found to recorded highest Cu content (90)
116 among the drying methods used.

Comment [U7]: Rewrite.

Comment [U8]: What do you mean? Independent of the drying method?

Comment [U9]: In which unit of measurement

117 For the drying methods, the sodium content did not observe any significant difference ($p \geq$
118 0.01). However, the highest (1.50%) was recorded by oven drying and the least (0.98%) was
119 recorded by sun drying. From the table, no significant difference ($p \geq 0.01$) was observed in
120 the phosphorus content for the dried Xylophia subjected to the different drying methods. Sun
121 dried Xylophia had the least (0.24%). Phosphorus content for solar dried Xylophia and oven
122 dried Xylophia was the highest (0.28%).

123 The zinc content recorded a significant difference ($p \leq 0.01$) within the ranges 19.75mg/kg to
124 41.75mg/kg for the drying methods. Across the means of the drying methods, Xylophia fruits
125 dried by oven had the highest zinc content (41.75mg/kg) followed by solar dried Xylophia

126 (28.25mg/kg) and the least (19.75mg/) was sun dried. The manganese showed significant
 127 differences ($p \leq 0.01$) in the content from 312mg/kg to 300mg/kg.
 128 Solar drying method had the highest (300mg/kg) content with oven and sun drying methods
 129 recording the least (312mg/kg) respectfully as shown in Table.

UNDER PEER REVIEW

161 **5. DISCUSSION AND CONCLUSION**

162

163 **5.2 EFFECTS OF THREE DRYING METHODS ON MINERAL COMPOSITION**

164 **5.2.1 Iron**

165 The Recommended Daily Allowance (RDA) of iron for infants, children and adults ranged
166 from 6 - 15mg/kg while that obtained from the study, was from 3.8mg/kg -4.6mg/kg, slightly
167 lower than that of the RDA. Iron helps in the growth and development of connective tissues
168 and hormones. Its consumption is also vital for the production of hemoglobin and the
169 oxygenation of red blood cells.

170 **5.2.2 Calcium**

171 Calcium as an essential mineral helps in bone and teeth formation, as well as the proper
172 growth of the body. Adanlawo and Ajibade, [1] reported a calcium content of 1.27% for the
173 *Xylopia* fruits but from the study, the calcium content was comparatively lower (0.20% to
174 0.23%). This might be due to prolonged drying.

175 **5.2.3 Potassium**

176 Increasing potassium in the diet protects against hypertension for people who are sensitive
177 to high levels of sodium [6]. Adanlawo and Ajibade, [1] as well as USDA, [12] reported
178 4.94% and 4% as the potassium content of the dried fruits.

179 From the study, lower potassium content within the range of 0.20% - 0.23% was obtained.
180 Potassium maintains the body's fluid volume and also promotes proper functioning of the
181 nervous system [9].

182 **5.2.4 Magnesium**

Comment [U10]: Insert conclusions in the end of this section.

Comment [U11]: Do you mean mg/day? Aren't you comparing different things?

Comment [U12]: In which species? Is it in general?

183 Magnesium (Mg) is an activator of many enzyme systems which maintains electrical
184 potential during nerve metabolism and Protein synthesis. It also helps in the assimilation of
185 potassium ([11]; [10]).

186 The magnesium content found in Ethiopian pepper fruits was reported by Adanlawo and
187 Ajibade [1] as 3.87%. Comparatively, the magnesium content (0.11% - 0.25) obtained from
188 the studies was lower probably due to **prolong drying**.

189 **5.2.5 Sodium**

190 Sodium is a micronutrient that maintains osmotic pressure and helps in the relaxation of
191 muscles [6]. The Sodium content according to USDA, [12] was reported as 0.0006 %.
192 Comparatively, high sodium content (0.98% - 1.50%) obtained from the studies, might be
193 due to differences in the drying methods used. Sodium helps in cell functioning as well as
194 regulation of the body's fluid volume.

195 **5.2.6 Phosphorus**

196 Phosphorus plays a vital role in metabolic processes and helps in the production of ATP.
197 *Xylopia* fruits is reported to contain phosphorus of 0.004% [1]. From the study, a higher
198 phosphorus content (0.24% - 0.28%) obtained might be due to differences in the drying
199 method used. Consumption of phosphorus helps maintain balance with calcium for strong
200 bones and teeth.

201 **5.2.7 Zinc**

202 Zinc helps in the breakdown of carbohydrates as well as maintaining the structural integrity
203 of proteins [4]. The **RDA for zinc is 15mg/kg** [5] from the study, the zinc content obtained
204 ranged from 0.82mg/kg - 3.06mg/kg which was comparatively lower than that reported by
205 Adanlawo and Ajibade, [1]. Infants, children, adolescents and pregnant women would be at

206 risk if the RDA for zinc is not met. To meet the RDA for the fruits, more of it needs to be
207 consumed. Solar dried fruits had higher calcium, iron, copper, and zinc while oven drying
208 resulted in higher potassium and phosphorus content.
