ABSTRACT

The *Patauá* (*Oenocarpus bataua* Mart.), also known as *Bataua* or *Patuá*, is a palm native from the Amazon, consumed among the local populations as well as the wine obtained from its pulp with high energy value. It is a monocaule palm tree reaching between 4-26 meters high, distributed in the Amazon rainforest both in wet forest of floodplains. The objective of this work was to study the bromatological, mineralogical composition, as well as the total phenolic compounds and antioxidant activity of pulp and seed of *Patauá*. As for mineral composition, the high concentrations of sodium for the seed (84.21 mg 100 g⁻¹) and pulp (71.21 mg 100 g⁻¹), as well as magnesium values of 48.31 mg 100 g⁻¹ for the seed and 41.23 mg 100 g⁻¹ for the pulp. Among the micronutrients, the high concentration of iron in the pulp is 1.84 mg 100 g⁻¹ for the pulps and the manganese seeds for the 1.10 mg 100 g⁻¹. The total phenolic compounds found in the seeds were relatively higher than for the pulps with values of 356.12 ± 0.12 mg GAEq g⁻¹ and 321.03 ± 0.43 mg GAEq g⁻¹, as well as the greater antioxidant activity for the seeds than for the pulp. Carotenoids concentration in the seeds found of 2.52 ± 0.04 mg mL⁻¹ and vitamin C concentrations were also quantified in trace concentrations, presenting the fruits of *Patauá* high biotechnological interest in the food and cosmetic industry.

Keywords: *Arecaceae*, *Bioresidues valorization*, *Carotenids*, *Antioxidant Activity*, *Minerals*.

1. INTRODUCTION

Arecaceae constitute or *Palmae* families, formed by about 2400 species distributed by various tropic and subtropical areas of the planet [1] as only the neotropic areas in Africa and Asia [2] as well as the neotropic areas of the Amazon Region and Central America [3] where more than 150 species of palm trees are found [4].

Among the palms of this family, it is worth mentioning or *Patauá* (*Oenocarpus bataua* Mart.), which has an occurrence with presence in the Amazon region, with popular traditional

34 people, presenting great economic potential, serving as a source of food, as well as
 35 preparing medicines [5-6]. This species is considered an Amazon region as an oligarchic
 36 species, exceeding its natural production at 11.1 tons / ha / year [7]. The Patauá fruits, it's
 37 purple colour, being or weight per fruit of between 6-8 grams [8]. Patauá, it presents
 38 numerous food applications, highlighting or *Patauá wine*, being a large source of rent as well
 39 as a production of oil, which shows flavor and properties similar to olive oil, as well as
 40 manufacturing of soda and ice cream [9]. The oil extracted of Patauá presents large
 41 quantities of unsaturated fatty acids [10]. The most important characteristic of this type of oil,
 42 and a high concentration of oleic acid and low concentration of palmitic acid, characteristic of
 43 other palm oils, as well as presenting applications to the cosmetics industry and not treating
 44 certainties [11]. Due to the fact that there are work related to the fruit of Patauá a palm, this
 45 study aimed to study the chemical, nutritional composition and bioactive molecules in pulp
 46 and Patauá seed with occurring in the state of Roraima, in the northern Amazon of Brazil.

47 2. MATERIAL AND METHODS

48 2.1. COLLECTION AND PROCESSING OF SAMPLES

49 The Patauá samples were collected in Rorainópolis city in the state of Roraima (Brazil) and
 50 were taken to the Chemistry laboratory of the Federal Institute of Roraima, where previously
 51 selected were those that had an acceptable conservation state for consumption, and the
 52 samples were separated. seed pulps and freezing at -80°C and lyophilized. The lyophilized
 53 material was sieved between 30-40 Mesh and stored in the dark until it was time for
 54 analysis.
 55

56 2.2. MINERAL ANALYSIS

57 The extraction of minerals in the different parts of the fruit was done according to the
 58 methodology described by EMBRAPA [12], which uses the perchloric nitric digestion (3:1) in
 59 a TECNAL model TE 0079 digester block, washed with distilled water until 25 mL for
 60 subsequent analysis. Calcium (Ca), magnesium (Mg), iron (Fe), copper (Cu), zinc (Zn),
 61 manganese (Mn) and aluminum (Al) were determined by flame atomic absorption
 62 spectrophotometry (FAAS). Shimadzu AA-7000, coupled with ASC-7000 auto sample.
 63 Calibration was performed with standard solutions prepared from 1000 mg L⁻¹ Qhemis High
 64 Purity PACU 1000-0125 commercial standards according to the specific conditions of each
 65 element (Table 1).
 66

67 Table 1. Analytical Parameters
 68

Element	Technique	(λ) nm	Calibration Line
Ca	FAAS	422.70	y= 0.0092 x - 0.0005 r ² = 0.999
Mg	FAAS	285.21	y= 0.2353 x - 0.0658 r ² = 0.997
P	UV-Vis	660.00	y= 0.2181 x - 0.0005 r ² = 0.999
K	EAE	766.50	y= 0.1231 x - 0.0013 r ² = 0.993
S	UV-Vis	420.00	y= 0.0213 x - 0.0012 r ² = 0.998
Fe	FAAS	248.33	y= 0.0399 x + 0.0067 r ² = 0.996
Zn	FAAS	213.80	y= 0.0600 x - 0.0171 r ² = 0.991
Mn	FAAS	279.48	y= 0.0282 x + 0.0041 r ² = 0.999
Cu	AAS	324.75	y= 0.0512 x - 0.0099 r ² = 0.997
Na	EAS	589.00	y= 1.0000 x + 0.0005 r ² = 0.999
Al	FAAS	309.30	y= 0.0088 x + 0.0005 r ² = 0.998
B	UV-Vis	460.00	y= 0.0537 x + 0.0002 r ² = 0.999

71 FAAS = Flame Atomic Absorption Spectroscopy. EAS = Flame Atomic Emission Spectroscopy. UV-
72 Vis=

73 UV-visible molecular spectrophotometry

74 As an ionization suppressor for Ca and Mg elements, 0.1% lantane oxide (La₂O) solution
75 was used. In the case of sodium (Na), it was determined in the same equipment, but in
76 atomic emission mode. Potassium (K) was determined by flame photometry using the
77 Digimed DH-62 Flame Photometer, calibrated using a Digimed standard solution with a
78 concentration range of 2 - 100 mg L⁻¹. For the determination of phosphorus (P) and boron
79 (B) elements, the visible ultraviolet molecular absorption spectrophotometry technique was
80 used using a SHIMADZU model UV-1800 equipment, according to the methodology by
81 EMBRAPA [12], of the colorimetric reaction with ammonium molybdate ((NH₄)₂MoO₄). In the
82 case of P, a blue complex was formed, where the readings were taken at $\lambda = 660$ nm; In
83 case B a complex was formed with yellow azomethine-H and absorbs light at $\lambda = 460$ nm.

84

85 2.3. CHARACTERIZATION OF BIOACTIVE MOLECULES

86

87 The determination of total phenolic compounds (CFT) was being used gallic acid as a
88 reference standard and absorbance readings in UV-VIS Photonics spectrophotometer at 765
89 nm [13]. The results were expressed as GAE in 100 g⁻¹ of sample. The antioxidant activity
90 was performed using two methodologies: on the one hand, the 1,1-diphenyl-2-
91 picrylhydrazine (DDPH) absorption method was used absorbance readings at 515 nm [14].
92 The second method to evaluate total antioxidant activity was by the method of reducing Fe³⁺
93 → Fe²⁺ [15].

94 The concentration of total carotenoids was made by the absorbance readings were taken on
95 UV-VIS molecular absorption spectrophotometer and readings at 661 nm, 644 nm and 470
96 nm respectively [16] Finally, vitamin C quantification was performed by UV-visible
97 molecular spectrophotometry and readings at 545 nm [17-18].

98

99 3. RESULTS AND DISCUSSION

100

101 3.1. MINERAL ANALYSIS

102

103 Minerals are essential nutrients for the body that cannot be synthesized and are
104 incorporated into the diet [19], consisting of inorganic substances that help regulate body
105 functions [20]. Table 2 shows the results of macro and micro minerals in the Pataua pulp and
106 seed, performed by different spectrophotometric techniques.

107 Table 2. Mineralogical composition of Pataua pulp and seed.

Macrominerals mg 100 g ⁻¹	Ca	K	Mg	Na	P
Pulp	2.35 ± 0.11	2.17 ± 0.07	41.23 ± 0.12	71.21 ± 0.02	41.23 ± 0.12
Seeds	0.71 ± 0.04	3.52 ± 0.04	48.31 ± 0.07	84.21 ± 0.02	1.17 ± 0.02
Microminerals mg 100 g ⁻¹	B	Cu	Fe	Mn	Zn
Pulp	0.37 ± 0.04	0.11 ± 0.01	1.84 ± 0.02	0.61 ± 0.09	0.97 ± 0.12
Seeds	0.22 ± 0.02	0.49 ± 0.07	0.91 ± 0.07	1.10 ± 0.03	0.21 ± 0.07

108 Average value of three repetitions and standard deviation at 95%.

109

110 Among the macrominerals (Table 2), sodium and magnesium concentrations with better
111 concentrations for seeds than for pulps stand out, with a value of 84.21 mg 100 g⁻¹ sodium
112 for seed and 48.31 mg 100. g⁻¹ of magnesium for the seed. Another of the **macrominerals**
113 whose concentration is significant in **Pataua** is the phosphorus, being highly superior in the
114 pulp (41.23 ± 0.12 mg 100 g⁻¹) compared to the seed. Phosphorus is an element that is
115 mineralized in the body as being found in the form of inorganic or organic phosphorus when
116 it is covalently linked to other biomolecules such as proteins, sugars and other cellular
117 compounds [21].

118

119 On the other hand, the other two macrominerals found in **Pataua** pulp and seed were Ca,
120 where the concentration was higher in the pulp with value of 2.35 mg 100 g⁻¹ and potassium
121 with higher value in seed 3.52 mg. 100 g⁻¹. Calcium consumption is of vital importance to
122 man, since it is the main constituent of bones, as well as involved in intracellular regulation
123 of different tissues [22]. On the other hand, potassium is another of the vitally important
124 elements for the organism, since it is responsible among other functions for maintaining the
125 hydroelectric balance in cells along with sodium [23]. Mineral requirements vary between 4-
126 15% of body weight, with 50% corresponding to calcium, 25% to phosphorus and another
127 25% corresponding to other minerals such as magnesium, sodium, potassium and copper
128 [24].

129

130 The micro minerals determined in this work (Table 2), were B, Cu, Fe, Mn and Cu, they are
131 necessary for health since their deficiencies are related to different diseases [25]. These
132 include iron concentrations in the pulp (1.84 mg 100g⁻¹) and zinc in the pulp with 0.97 mg
133 100 g⁻¹. Iron is one of the micronutrients of great importance for the organism. The iron
134 content of 3-5 grams in the body is divided into two categories: the one belonging to
135 functional compounds and the other corresponding to the iron stored in hepatocytes and
136 cells of the reticulum **system-endothelial** form of ferritin and hemosiderin [26] being daily iron
137 recommendations for men of 11 mg day⁻¹, and for women of 15 mg day⁻¹ [27]. Zinc is an
138 element distributed in the body in small proportions in concentrations ranging from 1.5 to 2.5
139 grams [28], and is an element implicated in the proper functioning of all cells in the body,
140 being essential especially for the development of the immune system [29]. Manganese, he
141 highlights in higher concentrations for the seed than for the **Pataua** pulp, being an essential
142 trace element that participates in different metabolic reactions, involved in immunological
143 reactions and regulation of ATP synthesis, as well as enzymatic cofactor [30]. Boron is
144 another of the elements identified in **Pataua** with higher concentration in the pulp with 0.37
145 mg 100 g⁻¹, being of great importance for the organism in bone growth, prevention of arthritis
146 as well as implicated in hormonal regulation processes. daily intake of 3 mg day⁻¹ [31].

147

148

3.2. BIOACTIVE MOLECULES

149 Table 3 shows the results of total phenolic compounds, antioxidant activity, total carotenoids
150 and ascorbic acid for **Pataua** pulp and seeds.

151 Table 3. Bioactive molecules in pulp and seeds of **Pataua**.

Sample	Phenolic Compounds mg GAEq g ⁻¹	Antioxidant activity μmol/g		Carotenoids μg mL ⁻¹	Vitamin C mg mL ⁻¹
		DPPH	Reduction Fe		
Pulps	321.03 ± 0.43	2147.12 ± 22.34	1856.21 ± 11.23	0.26 ± 0.02	0.008± 0.001

Seeds	356.12 ± 0.12	2632.21 ± 21.25	2123.12 ± 21.23	2.52 ± 0.04	0.005 ± 0.001
-------	---------------	-----------------	-----------------	-------------	---------------

152 Average value of three repetitions and standard deviation at 95%.

153 Total phenolic compounds measured in gallic acid equivalents per gram of sample, using
 154 standard gallic acid reference standard, were higher in seed with a concentration of 356.12 ±
 155 0.12 mg GAEg g⁻¹ than for a pulp with a concentration of 321.03 ± 0.43 mg GAEg. g⁻¹.
 156 According to the classification for phenolic compounds [32], they present a high
 157 concentration of phenolic compounds whose samples are over 500 mg GAEg g⁻¹, and
 158 according to this classification, the pulp and Patauá seed, have a high concentration of
 159 phenolic compounds. Antioxidant activity, measured by the DPPH technique and iron
 160 reduction method, showed higher antioxidant activity for the seed than for the pulp with both
 161 evaluated methods. The results obtained with this work are close to those obtained by
 162 Rezaire et al. (2014) [33], who studies extracts from *Euterpe oleracea* with GAE
 163 concentrations of 306.6 ± 7.4 mg GAEq g⁻¹ and antioxidant activity values determined by
 164 different methods within those studied in this work. As with other widely studied palm trees in
 165 this family, *Euterpe oleracea* has an interesting antioxidant potential, especially in vitro, and
 166 this antioxidant potential is related to the polyphenolic compounds it presents as
 167 anthocyanins (water-soluble pigments, responsible for the color purple) as well as other
 168 flavonoids [34].

169 The concentration of carotenoids in Patauá stands out, whose concentration is higher for
 170 seed than for pulp (Table 3), being a group of precursor bioactive molecules of vitamin E,
 171 since foods rich in this type of molecules decrease the risks of cardiovascular disease. The
 172 values obtained for carotenoids were 0.26 mg mL⁻¹ for the pulp and these values were
 173 higher for the seed with a concentration of 2.52 mg mL⁻¹. Other fruits of the same family,
 174 such as the *Astrocaryum aculeatum* pulp case, present carotenoid concentration between
 175 3.5-4.3 mg 100g⁻¹ [35] and *Attalea maripa* 0.4 mg 100 g⁻¹ [36]. Other type of compound with
 176 antioxidant activity is vitamin C, which was detected at low concentrations in Patauá pulp
 177 and seed (Table 3). However, it was found at low concentrations. that its deficiency can
 178 cause scurvy [37].

179

180 4. CONCLUSION

181

182 In this work was placed the biotechnological importance of this Amazon palm in terms of its
 183 mineralogical composition, as well as the characterization of bioactive molecules, especially
 184 the phenolic compounds in the disposable parts such as the seed, a disposable part of the
 185 fruit that could be of interest to the recovery of the bioactive molecules containing these bio-
 186 residues at industrial level. Also noteworthy are carotenoids, which can be used in the
 187 pharmaceutical and cosmetic industry. It is a species still little explored and can be used as
 188 a raw material in the food industry, since until now its use is limited to local populations.
